

## Part 2

Now in the second p— title: “StatInterference” author: “JRCosta” date: “December 9, 2016” output: pdf\_document —

```
## Warning: package 'knitr' was built under R version 3.3.2
```

ortion of the class, we’re going to analyze the ToothGrowth data in the R datasets package.

Load the ToothGrowth data and perform some basic exploratory data analyses.

```
#load data set from R's provided datasets
data(ToothGrowth)
```

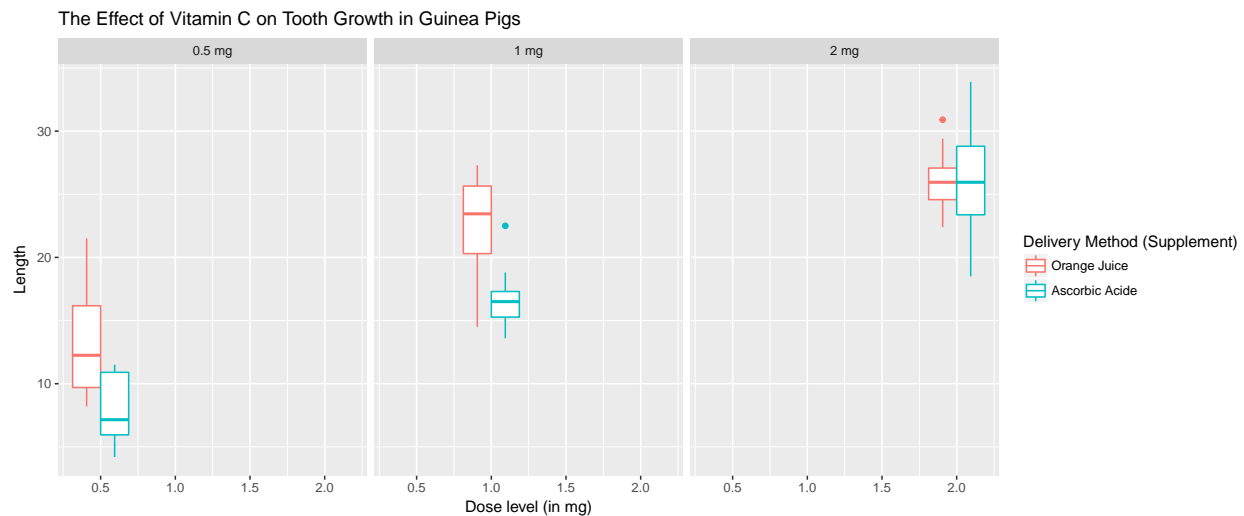

**Provide a basic summary of the data.**

*Note:* Please refer to appendix for a complete summary.

The following plot shows the growth length, per supplement at varying dosages (see R code and graph in appendix, fig 2.1):

```
## Warning: package 'ggplot2' was built under R version 3.3.2
```

```
## Warning: The labeller API has been updated. Labellers taking `variable` and
## `value` arguments are now deprecated. See labellers documentation.
```

**Use confidence intervals and/or hypothesis tests to compare tooth growth by supp and dose. (Only use the techniques from class, even if there’s other approaches worth considering)**

$H_0$  : Supplement *OJ* (*Orange Juice*) leads to more growth.

**State your conclusions and the assumptions needed for your conclusions.**

Based on (Week 3 video) (<https://class.coursera.org/statinference-011/lecture/243>) we can perform a `t.test` to determine whether this is true, assuming variances are equal (see complete output in appendix, fig 2.2):

```
##           [,1]      [,2]
## [1,] -0.1670064  7.567006
## [2,] -0.1670064  7.567006
```

Factors in `supp` show OJ comes first (see appendix, fig 2.3) and in both tests the result, is the same, column 1, corresponding to OJ (*Orange Juice*) is below zero, meaning it does not lead to more length.

# Appendix

## Part 2 - Supporting figures and exploratory analysis, ToothGrowth data.

### Description

“The Effect of Vitamin C on Tooth Growth in Guinea Pigs”

The response is the length of odontoblasts (teeth) in each of 10 guinea pigs at each of three dose levels of Vitamin C (0.5, 1, and 2 mg) with each of two delivery methods (orange juice or ascorbic acid).

### Summary information for ToothGrowth:

```
str(ToothGrowth)
```

```
## 'data.frame': 60 obs. of 3 variables:
## $ len : num 4.2 11.5 7.3 5.8 6.4 10 11.2 11.2 5.2 7 ...
## $ supp: Factor w/ 2 levels "OJ","VC": 2 2 2 2 2 2 2 2 2 2 ...
## $ dose: num 0.5 0.5 0.5 0.5 0.5 0.5 0.5 0.5 0.5 0.5 ...
```

```
summary(ToothGrowth)
```

```
##      len      supp      dose
## Min.   : 4.20   OJ:30   Min.    :0.500
## 1st Qu.:13.07   VC:30   1st Qu.:0.500
## Median :19.25           Median :1.000
## Mean   :18.81           Mean   :1.167
## 3rd Qu.:25.27           3rd Qu.:2.000
## Max.   :33.90           Max.    :2.000
```

```
head(ToothGrowth)
```

```
##      len supp dose
## 1  4.2   VC  0.5
## 2 11.5   VC  0.5
## 3  7.3   VC  0.5
## 4  5.8   VC  0.5
## 5  6.4   VC  0.5
## 6 10.0   VC  0.5
```

### Example coplot as per help(ToothGrowth):

```
require(graphics)
coplot(len ~ dose | supp, data = ToothGrowth, panel = panel.smooth,
       xlab = "ToothGrowth data: length vs dose, given type of supplement")
```

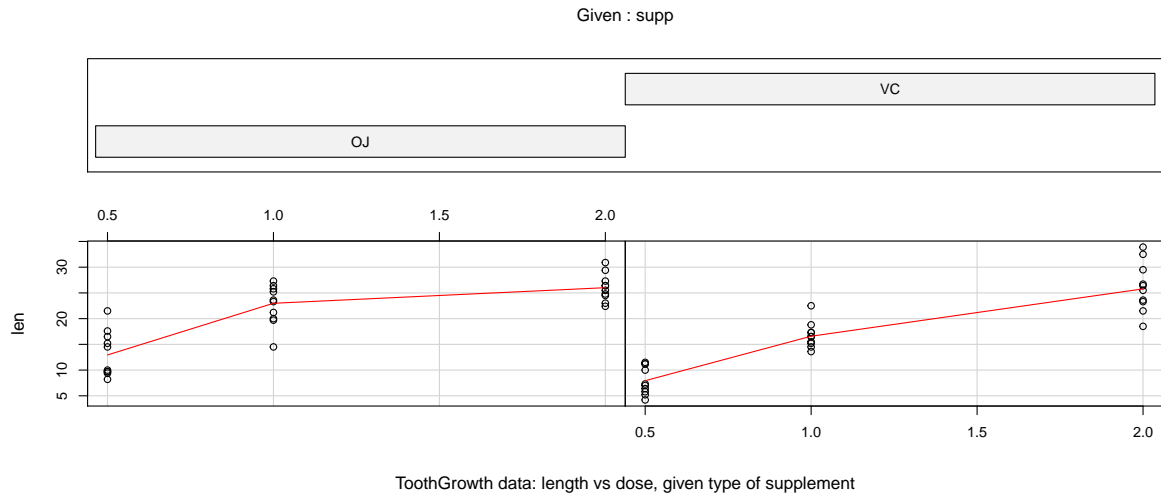

Figure 2.1

```
#plot and customize graph
g <- ggplot(ToothGrowth,aes(x = dose, y = len, color=supp))
g <- g + ggtitle("The Effect of Vitamin C on Tooth Growth in Guinea Pigs")
g <- g + xlab("Dose level (in mg)") + ylab("Length")
g <- g + scale_color_discrete(name="Delivery Method (Supplement)",
                             breaks=c("OJ", "VC"),
                             labels=c("Orange Juice", "Ascorbic Acide"))

g <- g + geom_boxplot()
g <- g + facet_grid(. ~ dose , labeller = function(variable, value){ paste0(value," mg") })
```

## Warning: The labeller API has been updated. Labellers taking `variable` and  
## `value` arguments are now deprecated. See labellers documentation.
